Definition 1.1 ***(Dynamic weakly verifiable puzzle (non interactive version))***
A dynamic weakly verifiable puzzle (DWVP) is defined by a probabilistic algorithm $P(\pi)$, called a problem poser, that takes as input chosen uniformly at random bitstring $\pi \in \{0,1\}^l$. The algorithm $P(\pi)$ produces circuits Γ_V, Γ_H and a puzzle $x \in \{0,1\}^*$. The circuit Γ_V takes as its input $q \in Q$ and an answer y. An answer y is a correct solution for q if and only if $\Gamma_V(q,y) = 1$. The circuit Γ_H on input q provides a hint such that $\Gamma_V(q, \Gamma_H(q)) = 1$. The algorithm S, called a solver, has oracle access to Γ_V and Γ_H. The calls to Γ_V are verification queries, the calls to Γ_H are hint queries. The solver S can ask at most h hint queries, v verification queries, and successfully solves a DWVP if and only if it makes a verification query (q,r) such that $\Gamma_V(q,r) = 1$, when it has not previously asked for a hint query on this q.

Experiment $B^{P^{(1)},D}(\pi)$
Solving a dynamic weakly verifiable puzzle

Oracle: Problem poser for a single instance of DWVP $P^{(g)}$, a solver circuit D.
Input: A random bitstring $\pi \in \{0,1\}^l$.

$(x, \Gamma_V, \Gamma_H) := P^{(1)}(\pi)$
Run $D^{(.)(.)}(x)$ with oracle access to Γ_V and Γ_H
    Let $(\widetilde{q}, y)$ be the first verification query of $D^{\Gamma_H,\Gamma_V}(x)$ such that $\Gamma_V(\widetilde{q}, y) = 1$
    Define $Q_{Hint} := \{q : D^{\Gamma_H,\Gamma_V}(x)$ asked a hint query on q$\}$
If $q \notin Q_{Hint}$
    return 1
else
    return 0

Definition 1.2 ***(k-wise direct product of dynamic weakly verifiable puzzles)***
Let $g : \{0,1\}^k \to \{0,1\}$ denote a monotone function, and $P^{(1)}$ an algorithm used to generate an instance of DWVP. A k-wise direct product of dynamic weakly verifiable puzzles is defined by an algorithm $P^{(g)}(\pi_1, \ldots, \pi_k)$, where $(\pi_1, \ldots, \pi_k) \in \{0,1\}^{kl}$ are chosen uniformly at random. The algorithm $P^{(g)}(\pi_1, \ldots, \pi_k)$ sequentially generates k independent instances of dynamic weakly verifiable puzzles, where in the i-th round $P^{(g)}$ runs $P^{(1)}(\pi_i)$ and obtains $(x_i, \Gamma_V^{(i)}, \Gamma_H^{(i)})$. Finally, $P^{(g)}$ outputs a verification circuit

$$\Gamma_V^{(g)}(q, r_1, \ldots, r_k) := g(\Gamma_V^{(1)}(q, r_1), \ldots, \Gamma_V^{(k)}(q, r_k)),$$

a hint circuit

$$\Gamma_H^{(g)}(q) := (\Gamma_H^{(1)}(q), \ldots, \Gamma_H^{(k)}(q)),$$

and a puzzle $x^{(k)} = (x_1, \ldots, x_k)$.

Experiment $A^{P^{(g)},C^{(.)(.)}}(\pi^{(k)})$
Solving k-wise direct product of dynamic weakly verifiable puzzles.

Oracle: Problem poser for k-wise direct product $P^{(g)}$, a solver circuit $C^{(.)(.)}$ with oracle access to hint and verification circuits.
Input: Random bitstring $\pi^{(k)} \in \{0,1\}^{lk}$.

$(x^{(k)}, \Gamma_V^{(g)}, \Gamma_H^{(g)}) := P^{(g)}(\pi^{(k)})$
Run $C^{(.)(.)}(x)$ with oracle access to Γ_V and Γ_H
    Let $(\widetilde{q}, y)$ be the first verification query of $C^{\Gamma_V^{(g)}, \Gamma_H^{(g)}}(x)$ such that $\Gamma_V^{(g)}(\widetilde{q}, y_1, \ldots, y_k) = 1$
    Define $Q_{Hint} := \{q : D^{\Gamma_V^{(g)}, \Gamma_H^{(g)}}(x^{(k)})$ asked a hint query on q$\}$
If $q \notin Q_{Hint}$
    return 1
else
    return 0

Theorem 1.3 ***Security amplification of a dynamic weakly verifiable puzzle.*** *Fix a problem poser $P^{(1)}$. There exists an algorithm $Gen(C, g, \varepsilon, \delta, n, v, h)$ which takes as input a circuit C, a monotone function g, parameters ε, δ, a security parameter n, number of verification v, and hint h queries asked by C, and outputs a circuit D such that following holds: If C is such that*

$$\Pr_{(\pi_1,\ldots,\pi_k)\in\{0,1\}^{lk}}[A^{P^{(g)},C}(\pi_1, \ldots, \pi_k) = 1] \geq \Pr_{\mu\leftarrow\mu_\delta^k}[g(\mu) = 1] + \varepsilon$$

then D satisfies almost surely

$$\Pr_{\pi\in\{0,1\}^l}[B^{P^{(1)},D}(\pi) = 1] \geq (\delta + \frac{\varepsilon}{6k})$$

and $Size(D) \leq Size(C)\frac{6k}{\varepsilon}$ and $Time(Gen) = poly(k, \frac{1}{\varepsilon}, n, v, h)$.

Experiment $E^{P^{(g)},C^{(.)(.)},Hash}(\pi_1, \ldots, \pi_k)$
Solving k-wise direct product with respect to the set P_{hash}

Oracle: Problem poser for k-wise direct product $P^{(g)}$
    Solver circuit $C^{(.)(.)}$ with oracle access to hint and verification circuits
    Function $Hash : Q \leftarrow \{0, \ldots, 2(h + v) - 1\}$
Input: Random bitstring $(\pi_1, \ldots, \pi_k) \in \{0, 1\}^{lk}$

$\pi^{(k)} := (\pi_1, \ldots, \pi_k)$
$(x^k, \Gamma_V^{(g)}, \Gamma_H^{(g)}) := P^{(g)}(\pi^k)$
Run $C^{\Gamma_V^{(g)}, \Gamma_H^{(g)}}(x^{(k)})$
    Let $(q_j, y_j^{(k)})$ be the first successful verification query if $C^{\Gamma_V^{(g)}, \Gamma_H^{(g)}}$ succeeds or an arbitrary verification query when it fails.

If $(\forall i < j : Hash(q_i) \neq 0)$ and $(Hash(q_j) = 1 \wedge \Gamma_V^{(g)}(q_j, y_j^{(k)}) = 1)$
    return 1
else
    return 0

Lemma 1.4 *Fix $P^{(1)}$ and let C be a circuit that succeeds in solving the k-wise direct product of DWVP produced by $P^{(1)}$ with probability ε making h hint and v verification queries. Then there exists a probabilistic algorithm, with oracle access to C, that runs in time $O((h + v)^4/\varepsilon^4)$ and with high probability outputs a function $Hash : Q \leftarrow \{0, 2(h + v) - 1\}$ such that success probability of C in random experiment E with respect to set P_{Hash} is at least $\frac{\varepsilon}{8(h+v)}$.*

Lemma 1.5 *For a fixed dynamic weakly verifiable puzzle $P^{(1)}$ there exists an algorithm $Gen(C, g, \varepsilon, \delta, n, v, h, Hash)$, which takes as input a circuit C, a monotone function g, a function $Hash : Q \leftarrow \{0, 2(h+v)-1\}$, parameters ε, δ, n, number of verification v, and hint h queries asked by C, and outputs a circuit D such that following holds:*
If C is such that

$$\Pr_{(\pi_1,\ldots,\pi_k)}[A^{P^{(g)},C,Hash}(\pi_1,\ldots,\pi_k)] \geq \Pr_{\mu\leftarrow\mu_\delta^k}[g(\mu)=1]+\varepsilon$$

then D satisfies almost surely

$$\Pr[B^{P^{(1)},D,Hash}(\pi)=1] \geq (\delta + \frac{\varepsilon}{6k})$$

and $Size(D) \leq Size(C)\frac{6k}{\varepsilon}$ and $Time(Gen) = poly(k, \frac{1}{\varepsilon}, n, v, h)$.

Random experiment $B^{P^{(1)},C,Hash}(\pi)$

Oracle: A circuit C, a function $Hash$ and a dynamic weakly verifiable puzzle $P^{(1)}$
Input: A random bitstring π of length at most $Time$?

$(x, \Gamma_v, \Gamma_H) := P^{(1)}(\pi)$
Run $D^{\Gamma_V,\Gamma_H}(x)$
    Let $(\widetilde{q_j}, \widetilde{r_j})$ be the first successful verification query if $D^{\Gamma_V,\Gamma_H}(x)$ succeeds or an arbitrary verification query when it fails.
If $(\forall i < j : Hash(q_i) \neq 0)$ and $Hash(q_j) = 1$
    return 1
else
    return 0

Random experiment $F^{Hash}(\pi_1, \ldots, \pi_k)$

Oracle: A function $Hash$
Input: A random bitstring π of length at most $Time$?

For $i = 1$ to k
    $(x, \Gamma_V^{(i)}, \Gamma_H^{(i)}) = P^{(1)}(\pi_i)$ **End** Let $\Gamma_V^{(g)}$ be a circuit computing $g(\Gamma_v^{(1)}(q, r_1), \ldots, \Gamma_V^{(k)}(q, r_k))$
Let $\Gamma_H^{(g)}$ be a circuit computing $(\Gamma_v^{(1)}(q, r_1), \ldots, \Gamma_V^{(k)}(q, r_k))$
$(q, \widetilde{r}) = \widetilde{C}^{\Gamma_V^{(g)},\Gamma_H^{(g)},Hash}(x_1, \ldots, x_k)$
If $(q, \widetilde{r}) = \perp$ then return $\perp$
For $i = 1$ to k
    $c_i = \Gamma_V^{(i)}(q, r_i)$
End
Return $(c_1, \ldots, c_k)$
