We write μ_δ to denote a Bernoulli distribution, where outcome 1 occurs with probability δ and 0 with probability $1-\delta$ where $0 \le \delta \le 1$. Moreover, we use μ_δ^k to denote a probability distribution over k-tuples, where each bit of a k-tuple is drawn independently according to μ_δ. Finally, let $u \leftarrow \mu_\delta^k$ denote that a k-tuple u is chosen according to μ_δ^k.

The protocol execution between two probabilistic algorithms A and B is denoted by $\langle A, B \rangle$. The output of A in such a protocol execution is denoted by $\langle A, B \rangle_A$ and of B by $\langle A, B \rangle_B$. Finally, let $\langle A, B \rangle_{\mathrm{trans}}$ denote the transcript of communication between $\langle A, B \rangle_{\mathrm{trans}}$.

We define a *two phase algorithm* $A := (A_1, A_2)$ as an algorithm where in the first phase an algorithm A_1 is executed and in the second phase an algorithm A_2.

We say that an event happens *almost surely* or with *high probability* if its has probability at least $1 - 2^{-n} poly(n)$.

Definition 1.1 (Dynamic weakly verifiable puzzle.) *A dynamic weakly verifiable puzzle (DWVP) is defined by a probabilistic algorithm P called a problem poser. A problem solver $S := (S_1, S_2)$ for P is a probabilistic two phase algorithm. We write $P_n(\pi)$ to denote the execution of P with the randomness fixed to $\pi \in \{0,1\}^n$, and $(S_1, S_2)(\rho)$ to denote the execution of both S_1 and S_2 with the randomness fixed to $\rho \in \{0,1\}^*$.*

In the first phase, the poser $P_n(\pi)$ and the solver $S_1(\rho)$ interact. As the result of the interaction $P_n(\pi)$ outputs a verification circuit Γ_V and a hint circuit Γ_H. The algorithm $S_1(\rho)$ produces no output. The circuit Γ_V takes as input $q \in Q$, an answer $y \in \{0,1\}^*$, and outputs a bit. We say that an answer (q, y) is a correct solution if and only if $\Gamma_V(q, y) = 1$. The circuit Γ_H on input $q \in Q$ outputs a hint such that $\Gamma_V(q, \Gamma_H(q)) = 1$.

In the second phase, S_2 takes as input $x := \langle P_n(\pi), S_1(\rho) \rangle_{\mathrm{trans}}$, and has oracle access to Γ_V and Γ_H. The execution of S_2 with the input x and the randomness fixed to ρ is denoted by $S_2(x, \rho)$. The queries of S_2 to Γ_V and Γ_H are called verification queries and hint queries respectively. The algorithm S_2 asks at most h hint queries, v verification queries, and succeeds if and only if it makes a verification query (q, y) such that $\Gamma_V(q, y) = 1$, and it has not previously asked for a hint query on q.

Definition 1.2 (k-wise direct-product of DWVPs.) *Let $g : \{0,1\}^k \to \{0,1\}$ be a monotone function and $P^{(1)}$ a problem poser as in Definition 1.1. The k-wise direct product of $P^{(1)}$ is a DWVP defined by a probabilistic algorithm $P^{(g)}$. We write $P_{kn}^{(g)}(\pi^{(k)})$ to denote the execution of $P^{(g)}$ with the randomness fixed to $\pi^{(k)} := (\pi_1, \ldots, \pi_k)$ where for each $1 \le i \le n : \pi_i \in \{0,1\}^n$. Let $(S_1, S_2)(\rho)$ be a solver for $P^{(g)}$ as in Definition 1.1. In the first phase, the algorithm $S_1(\rho)$ sequentially interacts in k rounds with $P_{kn}^{(g)}(\pi^{(k)})$. In the i-th round $S_1(\rho)$ interacts with $P_n^{(1)}(\pi_i)$, and as the result $P_n^{(1)}(\pi_1)$ generates circuits Γ_V^i, Γ_H^i. Finally, after k rounds $P_{kn}^{(g)}(\pi^{(k)})$ outputs a verification circuit*

$$\Gamma_V^{(g)}(q, y_1, \ldots, y_k) := g(\Gamma_V^1(q, y_1), \ldots, \Gamma_V^k(q, y_k))$$

and a hint circuit

$$\Gamma_H^{(k)}(q) := (\Gamma_H^1(q), \ldots, \Gamma_H^k(q)).$$

If it is clear from a context we omit the parameter n and write $P(\pi)$ instead of $P_n(\pi)$ where $\pi \in \{0,1\}^n$.

A verification query (q, y) of a solver S for which a hint query on this q has been asked before can not be a verification query that succeeds. Therefore, without loss of generality, we make the assumption that S does not ask verification queries on q for which a hint query has been asked before. Furthermore, we assume that once S asked a verification query that succeeds, it does not ask any further hint or verification queries.

Let C be a circuit that corresponds to a solver S as in Definition 1.1. Similarly as for a two phase algorithm, we write $C(\rho) := (C_1, C_2)(\rho)$ to denote that C in the first phase uses a circuit

C_1 and in the second phase a circuit C_2. Additionally, the randomness in both phases is fixed to $\rho \in \{0, 1\}^*$.

Experiment $Success^{P,C}(\pi, \rho)$

Oracle: A problem poser P, a solver circuit $C = (C_1, C_2)$.
Input: Bitstrings $\pi \in \{0, 1\}^n$, $\rho \in \{0, 1\}^*$.
Output: A bit $b \in \{0, 1\}$.

---

run $\langle P(\pi), C_1(\rho) \rangle$
    $(\Gamma_V, \Gamma_H) := \langle P(\pi), C_1(\rho) \rangle_P$
    $x := \langle P(\pi), C_1(\rho) \rangle_{\text{trans}}$

run $C_2^{\Gamma_V, \Gamma_H}(x, \rho)$
    if $C_2^{\Gamma_V, \Gamma_H}(x, \rho)$ asks a verification query (q, y) such that $\Gamma_V(q, y) = 1$ **then**
        return 1
return 0

We define the *success probability* of C in solving a puzzle defined by P as

$$\Pr_{\pi, \rho}[Success^{P,C}(\pi, \rho) = 1]. \tag{0.0.1}$$

Furthermore, we say that C succeeds for π, ρ if $Success^{P,C}(\pi, \rho) = 1$.

Theorem 1.3 (Security amplification for a dynamic weakly verifiable puzzle.) *Let $P^{(1)}$ be a fixed problem poser as in Definition 1.1, and $P^{(g)}$ be a poser for the k-wise direct product of $P^{(1)}$. There exists a probabilistic algorithm Gen with oracle access to: a solver circuit C for $P^{(g)}$, a monotone function $g : \{0, 1\}^k \to \{0, 1\}$ and problem posers $P^{(1)}$, $P^{(g)}$. Additionally, Gen takes as input parameters ε, δ, n, k the number of verification queries v and hint queries h asked by C, and outputs a solver circuit D for $P^{(1)}$ as in Definition 1.1 such that the following holds:*
If C is such that

$$\Pr_{\substack{\pi^{(k)} \in \{0,1\}^{kn} \\ \rho \in \{0,1\}^*}} \left[Success^{P^{(g)},C}(\pi^{(k)}, \rho) = 1 \right] \geq 16(h + v) \left(\Pr_{u \leftarrow \mu_\delta^k}[g(u) = 1] + \varepsilon \right)$$

then D satisfies almost surely

$$\Pr_{\substack{\pi \in \{0,1\}^n \\ \rho \in \{0,1\}^*}} \left[Success^{P^{(1)},D}(\pi, \rho) = 1 \right] \geq (\delta + \frac{\varepsilon}{6k}).$$

Additionally, D requires oracle access to g, $P^{(1)}$, C, and asks at most $\frac{6k}{\varepsilon} \log\left(\frac{6k}{\varepsilon}\right) h$ hint queries and one verification query. Finally, $Size(D) \leq Size(C) \cdot \frac{6k}{\varepsilon}$ and $Time(Gen) = poly(k, \frac{1}{\varepsilon}, n, v, h)$.

    Let $hash : Q \to \{0, 1, \ldots, 2(h + v) - 1\}$, the idea is to partition Q such that the set of preimages of 0 for $hash$ contains $q \in Q$ on which C is not allowed to ask hint queries, and the first successful verification query (q, y) of C is such that $hash(q) = 0$. Therefore, if C makes a verification query (q, y) such that $hash(q) = 0$, then we know that no hint query is ever asked on this q.

    We denote the i-th query of C by q_i if it is a hint query, and by (q_i, y_i) if it is a verification query. We define now an experiment $CanonicalSuccess$ in which we partition Q using a function

hash. We say that a solver circuit C *succeeds* in the experiment *CanonicalSuccess* if it asks a successful verification query (q_j, y_j) such that $hash(q_j) = 0$, and no hint query q_i is asked before (q_j, y_j) such that $hash(q_i) = 0$.

Experiment $CanonicalSuccess^{P,C,hash}(\pi, \rho)$

Oracle: A problem poser P, a solver circuit $C = (C_1, C_2)$,
      a function $hash : Q \to \{0, \dots, 2(h + v) - 1\}$.
Input: Bitstrings $\pi \in \{0, 1\}^n$, $\rho \in \{0, 1\}^*$.
Output: A bit $b \in \{0, 1\}$.

---

run $\langle P(\pi), C_1(\rho) \rangle$
    $(\Gamma_V, \Gamma_H) := \langle P(\pi), C_1(\rho) \rangle_P$
    $x := \langle P(\pi), C_1(\rho) \rangle_{\mathrm{trans}}$

run $C_2^{\Gamma_V, \Gamma_H}(x, \rho)$
    if C_2 does not succeed for any verification query **then**
        return 0
    Let (q_j, y_j) be the first verification query of C_2 such that $\Gamma_v(q_j, y_j) = 1$.

If $(\forall i < j : hash(q_i) \neq 0)$ **and** $(hash(q_j) = 0)$ **then**
    return 1
else
    return 0

We define the *canonical success probability* of a solver C for P with respect to a function *hash* as

$$\Pr_{\pi, \rho}[CanonicalSuccess^{P,C,hash}(\pi, \rho) = 1]. \tag{0.0.2}$$

For fixed *hash* and a problem poser P a *canonical success* of C for π, ρ is a situation where $CanonicalSuccess^{P,C,hash}(\pi, \rho) = 1$.

Let $\mathcal{H}$ be the family of pairwise independent functions $Q \to \{0, 1, \dots, 2(h + v) - 1\}$. We write $hash \leftarrow \mathcal{H}$ to denote that *hash* is chosen from $\mathcal{H}$ uniformly at random. We show that if a solver circuit C for $P^{(g)}$ often succeeds in the experiment *Success*, then there exists a function $hash \in \mathcal{H}$ such that C also often succeeds in the experiment *CanonicalSuccess*. [1]

Lemma 1.4 (Success probability in solving DWVP with respect to a function hash.)
For fixed P let C be a solver for P with the success probability at least γ, asking at most h hint queries and v verification queries. There exists a probabilistic algorithm FindHash that takes as input: parameters γ, n, the number of verification queries v and hint queries h, and has oracle access to C and P. Furthermore, FindHash runs in time $poly(h, v, \frac{1}{\gamma}, n)$, and with high probability outputs a function $hash \in \mathcal{H}$ such that the canonical success probability of C with respect to hash is at least $\frac{\gamma}{16(h+v)}$.

Proof. We fix a problem poser P and a solver C for P in the whole proof of Lemma 1.4. For all $m, n \in \{1, \dots, (h + v)\}$ and $k, l \in \{0, 1, \dots, 2(h + v) - 1\}$ by the pairwise independence property of $\mathcal{H}$, we have

$$\forall q_m, q_n \in Q, q_m \neq q_n : \Pr_{hash \leftarrow \mathcal{H}}[hash(q_m) = k \mid hash(q_n) = l] = \Pr_{hash \leftarrow \mathcal{H}}[hash(q_m) = k] = \frac{1}{2(h + v)}. \tag{0.0.3}$$

---

[1] It is possible to implement a random function *hash* efficiently by for example building its function table on the fly.

Let $\mathcal{P}_{Success}$ be a set containing all (π, ρ) for which $Success^{P,C}(\pi, \rho) = 1$. We fix $(\pi^*, \rho^*) \in \mathcal{P}_{Success}$, and are interested in the probability over a choice of function $hash$ of the event $CanonicalSuccess^{P,C,hash}(\pi^*, \rho^*) = 1$. Let (q_j, y_j) denote the first query such that $\Gamma_V(q_j, y_j) = 1$. We have

$$\Pr_{hash \leftarrow \mathcal{H}}[CanonicalSuccess^{P,C,hash}(\pi^*, \rho^*) = 1]$$

$$= \Pr_{hash \leftarrow \mathcal{H}}[hash(q_j) = 0 \wedge (\forall i < j : hash(q_i) \neq 0)]$$

$$= \Pr_{hash \leftarrow \mathcal{H}}[\forall i < j : hash(q_i) \neq 0 \mid hash(q_j) = 0] \Pr_{hash \leftarrow \mathcal{H}}[hash(q_j) = 0]$$

$$\overset{(0.0.3)}{=} \frac{1}{2(h+v)}\left(1 - \Pr_{hash \leftarrow \mathcal{H}}[\exists i < j : hash(q_i) = 0 \mid hash(q_j) = 0]\right)$$

$$\overset{(0.0.3)}{=} \frac{1}{2(h+v)}\left(1 - \Pr_{hash \leftarrow \mathcal{H}}[\exists i < j : hash(q_i) = 0]\right)$$

$$\overset{(u.b)}{\geq} \frac{1}{2(h+v)}\left(1 - \sum_{i<j} \Pr_{hash \leftarrow \mathcal{H}}[hash(q_i) = 0]\right)$$

$$\overset{(0.0.3)}{\geq} \frac{1}{4(h+v)}. \tag{0.0.4}$$

We denote the set of those (π, ρ) for which $CanonicalSuccess^{P,C,hash}(\pi, \rho) = 1$ by $\mathcal{P}_{Canonical}$. If for π ρ the circuit C succeeds canonically, then for the same π, ρ we also have $Success^{P,C}(\pi, \rho) = 1$. Hence, $\mathcal{P}_{Canonical} \subseteq \mathcal{P}_{Success}$, and we conclude

$$\Pr_{\substack{hash \leftarrow \mathcal{H} \\ \pi, \rho}}\left[CanonicalSuccess^{P,C,hash}(\pi, \rho) = 1\right]$$

$$= \Pr_{\substack{hash \leftarrow \mathcal{H} \\ (\pi,\rho) \in \mathcal{P}_{Success}}}[hash(q_j) = 0 \wedge (\forall i < j : hash(q_i) \neq 0)]$$

$$= \mathbb{E}_{(\pi,\rho) \in \mathcal{P}_{Success}}\left[\Pr_{hash \leftarrow \mathcal{H}}[hash(q_j) = 0 \wedge (\forall i < j : hash(q_i) \neq 0)]\right]$$

$$\overset{(0.0.4)}{\geq} \frac{\gamma}{4(h+v)}. \tag{0.0.5}$$

Algorithm: FindHash(γ, n, h, v)

Oracle: A problem poser P, a solver circuit C for P.
Input: Parameters γ, n. The number of h hint and v verification queries.
Output: A function $hash : Q \to \{0, 1, \ldots, 2(h+v) - 1\}$.

---

for $i = 1$ **to** $32n(h+v)^2/\gamma^2$ **do:**
    $hash \leftarrow \mathcal{H}$
    $count := 0$
    for $j := 1$ **to** $32n(h+v)^2/\gamma^2$ **do:**
        $\pi \xleftarrow{\$} \{0,1\}^n$
        $\rho \xleftarrow{\$} \{0,1\}^*$
        if $CanonicalSuccess^{P,C,hash}(\pi, \rho) = 1$ **then**
            $count := count + 1$

$$\mathbf{if}\ count \geq \frac{\gamma}{12(h+v)}\frac{32(h+v)^2}{\gamma^2}n\ \mathbf{then}$$
$$\mathbf{return}\ hash$$
$$\mathbf{return}\ \bot$$

We show that **FindHash** chooses $hash \in \mathcal{H}$ such that the canonical success probability of C with respect to $hash$ is at least $\frac{\gamma}{16(h+v)}$ almost surely. Let $\mathcal{H}_{Good}$ denote a family of functions $hash \in \mathcal{H}$ for which

$$\Pr_{\pi,\rho}\left[CanonicalSuccess^{P,C,hash}(\pi,\rho)=1\right] \geq \frac{\gamma}{8(h+v)}, \qquad (0.0.6)$$

and $\mathcal{H}_{Bad}$ be the family of functions $hash \in \mathcal{H}$ such that

$$\Pr_{\pi,\rho}\left[CanonicalSuccess^{P,C,hash}(\pi,\rho)=1\right] \leq \frac{\gamma}{16(h+v)}. \qquad (0.0.7)$$

Let N denote the number of iterations of the inner loop of **FindHash**. For a fixed $hash$, we define independent, identically distributed binary random variables $X_1, \ldots, X_N$ such that

$$X_i = \begin{cases} 1 & \text{if in the } i\text{-th iteration of the inner loop } count \text{ is increased} \\ 0 & \text{otherwise.} \end{cases}$$

We show now that **FindHash** is unlikely to return $hash \in \mathcal{H}_{Bad}$. For $hash \in \mathcal{H}_{Bad}$ by (0.0.7) we have $\mathbb{E}_{\pi,\rho}[X_i] \leq \frac{\gamma}{16(h+v)}$. Therefore, for any fixed $hash \in \mathcal{H}_{Bad}$ using the Chernoff bound we get [2]

$$\Pr_{\pi,\rho}\left[\frac{1}{N}\sum_{i=1}^{N}X_i \geq \frac{\gamma}{12(h+v)}\right] \leq \Pr_{\pi,\rho}\left[\frac{1}{N}\sum_{i=1}^{N}X_i \geq (1+\frac{1}{3})\mathbb{E}[X_i]\right] \leq e^{-\frac{\gamma}{16(h+v)}N/27} \leq e^{-\frac{2}{27}\frac{(h+v)}{\gamma}n}.$$

The probability that $hash \in \mathcal{H}_{Good}$, when picked, is not returned amounts

$$\Pr_{\pi,\rho}\left[\frac{1}{N}\sum_{i=1}^{N}X_i \leq \frac{\gamma}{12(h+v)}\right] \leq \Pr_{\pi,\rho}\left[\frac{1}{N}\sum_{i=1}^{N}X_i \leq (1-\frac{1}{3})\mathbb{E}[X_i]\right] \leq e^{-\frac{\gamma}{8(h+v)}N/18} \leq e^{-\frac{2}{9}\frac{(h+v)}{\gamma}n},$$

where we once more used the Chernoff bound. We show now that the probability of picking $hash \in \mathcal{H}_{Good}$ is at least $\frac{\gamma}{8(h+v)}$. We prove this statement by contradiction. Let assume us that

$$\Pr_{hash \leftarrow \mathcal{H}}[hash \in \mathcal{H}_{Good}] < \frac{\gamma}{8(g+v)}. \qquad (0.0.8)$$

We have

$$\Pr_{\substack{hash \leftarrow \mathcal{H} \\ \pi,\rho}}[CanonicalSuccess^{P,C,hash}(\pi,\rho)=1]$$

$$= \Pr_{\substack{hash \leftarrow \mathcal{H} \\ \pi,\rho}}[CanonicalSuccess^{P,C,hash}(\pi,\rho)=1 \mid hash \in \mathcal{H}_{Good}] \Pr_{hash \leftarrow \mathcal{H}}[hash \in \mathcal{H}_{Good}]$$

$$+ \Pr_{\substack{hash \leftarrow \mathcal{H} \\ \pi,\rho}}[CanonicalSuccess^{P,C,hash}(\pi,\rho)=1 \mid hash \notin \mathcal{H}_{Good}] \Pr_{hash \leftarrow \mathcal{H}}[hash \notin \mathcal{H}_{Good}]$$

$$\leq \Pr_{hash \leftarrow \mathcal{H}}[hash \in \mathcal{H}_{Good}] + \Pr_{\substack{hash \leftarrow \mathcal{H} \\ \pi,\rho}}[CanonicalSuccess^{P,C,hash}(\pi,\rho)=1 \mid hash \notin \mathcal{H}_{Good}]$$

$$\overset{\substack{(0.0.6) \\ (0.0.8)}}{<} \frac{\gamma}{8(h+v)} + \frac{\gamma}{8(h+v)} = \frac{\gamma}{4(h+v)},$$

---

[2] For $X = \sum_{i=1}^{N}X_i$ and $0 < \delta \leq 1$ we use the Chernoff bounds in the form $\Pr[X \geq (1+\delta)\mathbb{E}[X]] \leq e^{-\mathbb{E}[X]\delta^2/3}$ and $\Pr[X \leq (1-\delta)\mathbb{E}[X]] \leq e^{-\mathbb{E}[X]\delta^2/2}$.

but this contradicts (0.0.5). Therefore, we know that the probability of choosing a $hash \in \mathcal{H}_{Good}$ amounts at least $\frac{\gamma}{8(h+v)}$ where the probability is taken over a choice of $hash$.

We show that $FindHash$ picks in one of its iteration $hash \in \mathcal{H}_{Good}$ almost surely. Let K be the number of iterations of the outer loop of $FindHash$ and Y_i be a random variable for the event that in the i-th iteration of the outer loop $hash \notin \mathcal{H}_{Good}$ is picked. We conclude using $\Pr_{hash \leftarrow \mathcal{H}}[hash \in \mathcal{H}_{Good}] \geq \frac{\gamma}{8(g+v)}$ and $K \leq \frac{32(h+v)^2}{\gamma^2}n$ that

$$\Pr_{hash \leftarrow \mathcal{H}}\left[\bigcap_{1 \leq i \leq K} Y_i\right] \leq \left(1 - \frac{\gamma}{8(h+v)}\right)^{\frac{32(h+v)^2}{\gamma^2}n} \leq e^{-\frac{\gamma}{8(h+v)}\frac{32(h+v)^2}{\gamma^2}n} \leq e^{-\frac{4(h+v)}{\gamma}n}. \qquad \square$$

Circuit $\widetilde{C}_2^{\Gamma_H, C_2, hash}(x, \rho)$

Oracle: A hint circuit Γ_H, a circuit C_2,
        a function $hash : Q \to \{0, 1, \ldots, 2(h+v) - 1\}$.
Input: Bitstrings $x \in \{0,1\}^*$, $\rho \in \{0,1\}^*$.
Output: A tuple (q, y).

---

run $C_2^{(\cdot,\cdot)}(x, \rho)$
     if $C_2^{(\cdot,\cdot)}(x, \rho)$ asks a hint query on q **then**
         if $hash(q) = 0$ **then**
             return $\perp$
         else
             answer the query of $C_2^{(\cdot,\cdot)}(x, \rho)$ using $\Gamma_H(q)$

     if $C_2^{(\cdot,\cdot)}(x, \rho)$ asks a verification query (q, y) **then**
         if $hash(q) = 0$ **then**
             return (q, y)
         else
             answer the verification query of $C_2^{(\cdot,\cdot)}(x, \rho)$ with 0
return $\perp$

Given $C = (C_1, C_2)$ we define a circuit $\widetilde{C} = (C_1, \widetilde{C}_2)$. Every hint query q asked by $\widetilde{C}$ is such that $hash(q) \neq 0$. Furthermore, $\widetilde{C}$ asks no verification queries, instead it returns $\perp$ or (q, y) such that $hash(q) = 0$.

We say that for a fixed π, ρ, $hash$ the circuit $\widetilde{C}$ *succeeds* if for $x := \langle P(\pi), C_1(\rho)\rangle_{\text{trans}}$, $(\Gamma_V, \Gamma_H) := \langle P(\pi), C_1(\rho)\rangle_P$, we have

$$\Gamma_V(\widetilde{C}_2^{\Gamma_H, C_2, hash}(x, \rho)) = 1.$$

Lemma 1.5 *For fixed P, C and hash the following statement is true*

$$\Pr_{\pi, \rho}[CanonicalSuccess^{P,C,hash}(\pi, \rho) = 1] \leq \Pr_{\substack{\pi, \rho \\ x := \langle P(\pi), C_1(\rho)\rangle_{trans} \\ (\Gamma_V, \Gamma_H) := \langle P(\pi), C_1(\rho)\rangle_P}}[\Gamma_V(\widetilde{C}_2^{\Gamma_H, C_2, hash}(x, \rho)) = 1]$$

Proof. If for some fixed π, ρ and *hash* the circuit C succeeds canonically, then for the same π, ρ and *hash* also $\widetilde{C}$ succeeds. Using this observation, we conclude that

$$\Pr_{\pi,\rho}\left[CanonicalSuccess^{P,C,hash}(\pi,\rho)=1\right]$$

$$= \mathop{\mathbb{E}}_{\pi,\rho}\left[CanonicalSuccess^{P,C,hash}(\pi,\rho)=1\right]$$

$$\leq \mathop{\mathbb{E}}_{\substack{\pi,\rho \\ x:=\langle P(\pi),C_1(\rho)\rangle_{\mathrm{trans}} \\ (\Gamma_V,\Gamma_H):=\langle P(\pi),C_1(\rho)\rangle_P}}[\Gamma_V(\widetilde{C}_2^{\Gamma_H,C_2,hash}(x,\rho))=1]$$

$$= \mathop{\Pr}_{\substack{\pi,\rho \\ x:=\langle P(\pi),C_1(\rho)\rangle_{\mathrm{trans}} \\ (\Gamma_V,\Gamma_H):=\langle P(\pi),C_1(\rho)\rangle_P}}[\Gamma_V(\widetilde{C}_2^{\Gamma_H,C_2,hash}(x,\rho))=1]$$

$\square$

Lemma 1.6 (Security amplification of a dynamic weakly verifiable puzzle with respect to hash.) *For fixed $P^{(1)}$ there exists an algorithm Gen that takes as input parameters ε,δ,n,k has oracle access to $P^{(1)}$, $P^{(g)}$, $\widetilde{C}$, functions hash $: Q \to \{0,1,\ldots,2(h+v-1)\}$, $g:\{0,1\}^k \to \{0,1\}$, and outputs a circuit $D:=(D_1,D_2)$ such that the following holds:*
If $\widetilde{C}:=(C_1,\widetilde{C}_2)$ with oracle access to hash and a solver circuit $C:=(C_1,C_2)$ for $P^{(g)}$, which asks at most h hint queries and v verification queries, is such that

$$\mathop{\Pr}_{\substack{\pi^{(k)}\in\{0,1\}^{kn},\rho\in\{0,1\}^* \\ x:=\langle P^{(g)}(\pi^{(k)}),C_1(\rho)\rangle_{\mathrm{trans}} \\ (\Gamma_H^{(k)},\Gamma_V^{(g)}):=\langle P^{(g)}(\pi^{(k)}),C_1(\rho)\rangle_{P^{(g)}}}}[\Gamma_V^{(g)}(\widetilde{C}_2^{\Gamma_H^{(k)},C_2,hash}(x,\rho))=1] \geq \mathop{\Pr}_{u\leftarrow\mu_\delta^k}[g(u)=1]+\varepsilon,$$

then D satisfies almost surely

$$\mathop{\Pr}_{\substack{\pi\in\{0,1\}^n,\rho\in\{0,1\}^* \\ x:=\langle P^{(1)}(\pi),D_1^{P^{(1)},\widetilde{C}}(\rho)\rangle_{\mathrm{trans}} \\ (\Gamma_H,\Gamma_V):=\langle P^{(1)}(\pi),D_1^{P^{(1)},\widetilde{C}}(\rho)\rangle_{P^{(1)}}}}[\Gamma_V(D_2^{\Gamma_H,P^{(1)},\widetilde{C},hash,g}(x,\rho))=1] \geq (\delta+\frac{\varepsilon}{6k}).$$

Furthermore, D has oracle access to hint circuit, $P^{(1)}$, $\widetilde{C}$, hash, g, and asks at most $\frac{6k}{\varepsilon}\log\left(\frac{6k}{\varepsilon}\right) h$ hint queries and no verification queries. Finally, $Size(D) \leq Size(C)\frac{6k}{\varepsilon}$ and $Time(Gen) = poly(k,\frac{1}{\varepsilon},n,v,h)$.

Before proving Lemma 1.6 we define additional algorithms that are later used by *Gen*. First, we are interested in the probability that for $u \leftarrow \mu_\delta^k$ and a bit $b \in \{0,1\}$ the function g with the first input bit set to b takes value 1. The estimate of this probability is calculated by the algorithm *EstimateFunctionProbability*.

Algorithm: EstimateFunctionProbability$^g(b,k,\varepsilon,\delta)$

Oracle: A function $g:\{0,1\}^k \to \{0,1\}$.
Input: A bit $b \in \{0,1\}$, parameters k,ε,δ.
Output: An estimate $\widetilde{g}$ of $\Pr_{u\leftarrow\mu_\delta^k}[g(b,u_2,\ldots,u_k)=1]$.

---

for $i:=1$ **to** $\frac{64^2}{\varepsilon^2}n$ **do:**
    $u \leftarrow \mu_\delta^{(k)}$

$$g_i := g(b, u_2, \ldots, u_k)$$

$$\textbf{return } \frac{\varepsilon^2}{64^2 n} \sum_{i=1}^{\frac{64^2}{\varepsilon^2} n} g_i$$

Lemma 1.7 *The algorithm **EstimateFunctionProbability**$^g(b, k, \varepsilon, \delta)$ outputs an estimate $\widetilde{g}$ of $\Pr_{u \leftarrow \mu_\delta^k}[g(b, u_2, \ldots, u_k) = 1]$ where $b \in \{0, 1\}$ such that $|\widetilde{g} - \Pr_{u \leftarrow \mu_\delta^k}[g(b, u_2, \ldots, u_k) = 1]| \leq \frac{\varepsilon}{8k}$ almost surely.*

Proof. We define independent, identically distributed binary random variables $K_1, K_2, \ldots, K_{\frac{64k^2}{\varepsilon^2} n}$ such that for each $1 \leq i \leq \frac{64k^2}{\varepsilon^2} n$ the random variable K_i takes value g_i. We use the Chernoff bound to obtain [3]

$$\Pr\left[\left|\left(\frac{\varepsilon^2}{64k^2 n} \sum_{i=1}^{\frac{64k^2}{\varepsilon^2} n} K_i\right) - \mathbb{E}[K_i]\right| \geq \frac{\varepsilon}{8k}\right] \leq 2 \cdot e^{-n/3}. \qquad \square$$

The next algorithm **EvalutePuzzles**$^{P^{(1)}, P^{(g)}, \widetilde{C}, hash}(\pi^{(k)}, \rho)$ evaluates which of k puzzles of the k-wise direct product defined by $P^{(g)}$ are solved successfully by $\widetilde{C}(\rho) := (C_1, \widetilde{C}_2)(\rho)$. To decide whether the i-th puzzle of the k-wise direct product is solved successfully we need to gain access to the verification oracle for the puzzle generated in the i-th round of the interaction between $P^{(g)}$ and $\widetilde{C}$. Therefore, in the algorithm **EvalutePuzzles**, we use $P^{(1)}$, and invoke it k times to simulate the interaction with $C_1(\rho)$. Let us introduce some additional notation. We denote by $\langle P^{(1)}(\pi_i), C_1(\rho)\rangle^i$ the execution of the i-th round of the simulation, and by $\langle P^{(1)}(\pi_i), C_1(\rho)\rangle^i_{P^{(1)}}$ the output of $P^{(1)}(\pi_i)$ in the i-th round. Furthermore, we write $\langle P^{(1)}(\pi_i), C_1(\rho)\rangle^i_{trans}$ to denote a transcript of communication in the i-th round.

Algorithm: EvalutePuzzles$^{P^{(1)}, P^{(g)}, \widetilde{C}, hash}(\pi^{(k)}, \rho, n, k)$

Oracle: Problem posers $P^{(1)}$, $P^{(g)}$, a circuit $\widetilde{C} = (C_1, \widetilde{C}_2)$,
a function $hash : Q \rightarrow \{0, 1, \ldots, 2(h + v) - 1\}$.
Input: Bitstrings $\pi^{(k)} \in \{0, 1\}^{kn}$, $\rho \in \{0, 1\}^*$, parameters n, k.
Output: A tuple $(c_1, \ldots, c_k) \in \{0, 1\}^k$.

---

for $i := 1$ **to** k **do:**   //simulate k rounds of interaction
    $(\Gamma_V^i, \Gamma_H^i) := \langle P^{(1)}(\pi_i), C_1(\rho)\rangle^i_{P^{(1)}}$
    $x_i := \langle P^{(g)}(\pi^{(k)}), C_1(\rho)\rangle^i_{trans}$
$x := (x_1, \ldots, x_k)$
$\Gamma_H^{(k)} := (\Gamma_H^1, \ldots, \Gamma_H^k)$
$(q, y_1, \ldots, y_k) := \widetilde{C}_2^{\Gamma_H^{(k)}, C_2, hash}(x, \rho)$
$(c_1, \ldots, c_k) := (\Gamma_V^1(q, y_1), \ldots, \Gamma_V^k(q, y_k))$
return $(c_1, \ldots, c_k)$

All puzzles used by the algorithm **EvalutePuzzles** are generated internally. Thus, the algorithm can answer itself all queries of $\widetilde{C}_2$ to the hint oracle.

We are interested in the success probability of $\widetilde{C}$ with the bitstring π_1 fixed to π^* when the fact whether $\widetilde{C}$ succeeds in solving the first puzzle defined by $P^{(1)}(\pi_1)$ is neglected, and instead

---

[3]For independent Bernoulli distributed random variables $X_1, \ldots, X_n$ with $X := \sum_{i=1}^n X_i$ and $0 \leq \delta \leq 1$ we use the Chernoff bound in the form $\Pr[|X - \mathbb{E}[X]| \geq \delta \mathbb{E}[X]] \leq 2e^{-\mathbb{E}[X]\delta^2/3}$.

8

a bit $b \in \{0, 1\}$ is used. More formally, we define the surplus $S_{\pi^*, b}$ as

$$S_{\pi^*, b} = \Pr_{\pi^{(k)}, \rho} [g(b, c_2, \ldots, c_k) = 1 \mid \pi_1 = \pi^*] - \Pr_{u \leftarrow \mu^{(k)}} [g(b, u_2, \ldots, u_k) = 1]. \qquad (0.0.9)$$

The algorithm **EstimateSurplus** returns an estimate $\widetilde{S}_{\pi^*, b}$ for $S_{\pi^*, b}$.

Algorithm: EstimateSurplus$^{P^{(1)}, P^{(g)}, \widetilde{C}, g, hash}(\pi^*, b, k, \varepsilon, \delta, n)$

Oracle: Problem posers $P^{(1)}$, $P^{(g)}$, a circuit $\widetilde{C}$, a function $g : \{0, 1\}^k \to \{0, 1\}$
         a function $hash : Q \to \{0, 1, \ldots, 2(h + v) - 1\}$.
Input: A bistring $\pi^* \in \{0, 1\}^n$, a bit $b \in \{0, 1\}$, parameters $k, \varepsilon, \delta, n$.
Output: An estimate $\widetilde{S}_{\pi^*, b}$ for $S_{\pi^*, b}$.

$\widetilde{g}_b := \textbf{EstimateFunctionProbability}^g(b, k, \varepsilon, \delta, n)$
for $i := 1$ **to** $\frac{64k^2}{\varepsilon^2} n$ **do:**
     $(\pi_2, \ldots, \pi_k) \xleftarrow{\$} \{0, 1\}^{(k-1)n}$
     $\rho \xleftarrow{\$} \{0, 1\}^*$
     $(c_1, \ldots, c_k) := \textbf{EvalutePuzzles}^{P^{(1)}, P^{(g)}, \widetilde{C}, hash}((\pi^*, \pi_2, \ldots, \pi_k), \rho)$
     $\widetilde{s}^i_{\pi^*, b} := g(b, c_2, \ldots, c_k)$
return $\left(\frac{\varepsilon^2}{64k^2 n} \sum_{i=1}^{\frac{64k^2}{\varepsilon^2} n} \widetilde{s}^i_{\pi^*, b} \right) - \widetilde{g}_b$

Lemma 1.8 *The estimate $\widetilde{S}_{\pi^*, b}$ returned by **EstimateSurplus** differs from $S_{\pi^*, b}$ by at most $\frac{\varepsilon}{4k}$ almost surely.*

Proof. We use the union bound and similar argument as in Lemma 1.7 which yields that $\frac{\varepsilon^2}{64k^2 n} \sum_{i=1}^{\frac{64k^2}{\varepsilon^2} n} \widetilde{s}^i_{\pi^*, b}$ differs from $\mathbb{E}[g(b, c_2, \ldots, c_k)]$ by at most $\frac{\varepsilon}{8k}$ almost surely. Together, with Lemma 1.7 we conclude that the surplus estimate returned by **EstimateSurplus** differs from $S_{\pi^*, b}$ by at most $\frac{\varepsilon}{4k}$ almost surely. $\qquad \square$

Circuit $C_1'^{\widetilde{C}, P^{(1)}}(\rho)$

Oracle: A circuit $\widetilde{C} = (C_1, \widetilde{C}_2)$, a poser $P^{(1)}$.
Input: A bitstring $\rho \in \{0, 1\}^*$
Hard-coded: A bitstring $\pi^* \in \{0, 1\}^n$

Simulate $\langle P^{(1)}(\pi^*), C_1(\rho) \rangle^1$
Use $C_1(\rho)$ for the remaining $k - 1$ rounds of interaction.

To make the notation easier we omit oracle access to a circuit C in the code excerpts of circuits C_2 and $D-2$ and write $\widetilde{C}_2^{\Gamma_H^{(k)}, hash}$ instead of $\widetilde{C}_2^{\Gamma_H^{(k)}, C, hash}$. We make sure that it is clear from the context which circuit C is used by $\widetilde{C}_2$.

Circuit $\widetilde{C}_2'^{\Gamma_H^{(k-1)}, \widetilde{C}, hash}(x^{(k-1)}, \rho)$

Oracle: A hint oracle $\Gamma_H^{(k-1)} := (\Gamma_H^2, \ldots, \Gamma_H^k)$, a circuit $\widetilde{C} = (C_1, \widetilde{C}_2)$,
         a function $hash : Q \to \{0, 1, \ldots, 2(h + v) - 1\}$

Input: A tuple $x^{(k-1)} := (x_2, \ldots, x_k) \in \{0,1\}^*$, a bitstring $\rho \in \{0,1\}^*$
Hard-coded: A bitstring $\pi^* \in \{0,1\}^n$

Simulate $\langle P^{(1)}(\pi^*), C_1(\rho) \rangle^1$
$\qquad (\Gamma_H^*, \Gamma_V^*) := \langle P^{(1)}(\pi^*), C_1(\rho) \rangle_{P^{(1)}}^1$
$\qquad x^* := \langle P^{(1)}(\pi^*), C_1(\rho) \rangle_{\text{trans}}^1$
$\Gamma_H^{(k)} := (\Gamma_H^*, \Gamma_H^2, \ldots, \Gamma_H^k)$
$x^{(k)} := (x^*, x_2, \ldots, x_k)$
$(q, y_1, \ldots, y_k) := \widetilde{C}_2^{\Gamma_H^{(k)}, hash}(x^{(k)}, \rho)$
return $(q, y_2, \ldots, y_k)$

We are ready to define the circuit $D = (D_1, D_2)$ and the algorithm *Gen*.

Circuit $D_1^{P^{(1)}, \widetilde{C}}(r)$

Oracle: A poser $P^{(1)}$, a circuit $\widetilde{C} = (C_1, \widetilde{C}_2)$.
Input: A tuple $r := (\rho, \sigma)$ where $\rho \in \{0,1\}^*$ and $\sigma \in \{0,1\}^*$.

Interact with the problem poser $\langle P^{(1)}, C_1(\rho) \rangle^1$.

Circuit $D_2^{P^{(1)}, P^{(g)}, \widetilde{C}, hash, g, \Gamma_H^*}(x^*, \rho)$

Oracle: A poser $P^{(1)}$, a solver circuit $\widetilde{C} = (C_1, \widetilde{C}_2)$,
$\qquad\quad$ functions $hash : Q \to \{0, 1, \ldots, 2(h+v) - 1\}$, $g : \{0,1\}^k \to \{0,1\}$,
$\qquad\quad$ verification and hint circuits Γ_V^*, Γ_H^* for $P^{(1)}$.
Input: Bitstrings $x^* \in \{0,1\}^*$, $\rho := (\tau, \sigma)$ such that $\tau \in \{0,1\}^*$ and $\sigma \in \{0,1\}^*$
Output: A tuple (q, y^*).

---

for at most $\frac{6k}{\varepsilon} \log(\frac{6k}{\varepsilon})$ iterations **do:**
$\quad (\pi_2, \ldots, \pi_k) \leftarrow$ read next $(k-1) \cdot n$ bits from σ
$\quad$ **for** $i := 2$ **to** k **do:**
$\qquad$ **run** $\langle P^{(1)}(\pi_i), C_1(\rho) \rangle^i$
$\qquad\quad (\Gamma_V^i, \Gamma_H^i) := \langle P^{(1)}(\pi_i), C_1(\tau) \rangle_{P^{(1)}}^i$
$\qquad\quad x_i := \langle P^{(1)}(\pi_i), C_1(\tau) \rangle_{\text{trans}}^i$
$\quad \Gamma_H^{(k)}(q) := (\Gamma_H^*(q), \Gamma_H^2(q), \ldots, \Gamma_H^k(q))$
$\quad (q, y^*, y_2, \ldots, y_k) := \widetilde{C}_2^{\Gamma_H^{(k)}, hash}((x^*, x_2, \ldots, x_k), \tau)$
$\quad (c_2, \ldots, c_k) := (\Gamma_V^2(q, y_2), \ldots, \Gamma_V^k(q, y_k))$
$\quad$ **if** $g(1, c_2, \ldots, c_k) = 1$ **and** $g(0, c_2, \ldots, c_k) = 0$ **then**
$\qquad$ **return** (q, y^*)
return $\perp$

Algorithm $Gen^{P^{(1)}, P^{(g)}, \widetilde{C}, g, hash}(\varepsilon, \delta, n, v, h, k)$

Oracle: Posers $P^{(1)}$, $P^{(g)}$, circuit $\widetilde{C}$, functions $g : \{0,1\}^k \to \{0,1\}$,
$\qquad\quad hash : Q \to \{0, 1, \ldots, 2(h+v) - 1\}$.
Input: Parameters ε, δ, n, k, the number of verification v and hint h queries.
Output: A circuit D.

```
for i := 1 to (6k/ε)n do:
    π* ←$ {0,1}^n
    S̃_{π*,0} := EstimateSurplus^{P^{(1)},P^{(g)},C̃,g,hash}(π*, 0, k, ε, δ, n)
    S̃_{π*,1} := EstimateSurplus^{P^{(1)},P^{(g)},C̃,g,hash}(π*, 1, k, ε, δ, n)
    if ∃b ∈ {0,1} : S̃_{π*,b} ≥ (1 - 3/4k)ε then
        Let C'_1 have oracle access to C̃, and have hard-coded π*
        Let C̃'_2 have oracle access to C̃, and have hard-coded π*.
        C̃' := (C'_1, C̃'_2)
        g'(b_2,...,b_k) := g(b, b_2,...,b_k)
        return Gen^{P^{(1)},P^{(g)},C̃',g',hash}(ε, δ, n, v, h, k - 1)
// all estimates are lower than (1 - 3/4k)ε
return D^{P^{(1)},P^{(g)},C̃,hash,g}
```

Proof (Lemma 1.6). First let us consider the case where $k = 1$. The function $g : \{0,1\} \to \{0,1\}$ is either the identity or a constant function. If g is the identity function, then the circuit D returned by Gen directly uses $\widetilde{C}$ to find a solution. From the assumptions of Lemma 1.6 we know that $\widetilde{C}$ succeeds with probability at least $\delta + \varepsilon$. Hence, D trivially satisfies the statement of Lemma 1.6. If g is a constant function the statement is vacuously true.

The general case is more involved. We distinguish two possibilities. If Gen manages to find in one of the iterations π^* such that an estimate $\widetilde{S}_{\pi^*,b} \geq (1 - \frac{3}{4k})\varepsilon$, then we define a new monotone function $g'(b_2, \ldots, b_k) := g(b, b_2, \ldots, b_k)$ and a circuit $\widetilde{C}' = (C'_1, \widetilde{C}'_2)$ with oracle access to $\widetilde{C} := (C_1, \widetilde{C}_2)$, where C'_1 first internally simulates the interaction between C_1 and $P^{(1)}(\pi^*)$, and then use C_1 to interact with $P^{(g')}$. The circuit $\widetilde{C}'_2$ uses $\widetilde{C}$ to obtain a solution $(q, y_1, \ldots, y_k)$ for the k-wise direct product with π_1 fixed to π^*, and returns $(q, y_2, \ldots, y_k)$. One of the surplus estimates $\widetilde{S}_{\pi^*,b}$ is greater or equal $1 - \frac{3}{4k}\varepsilon$, and using Lemma 1.8 we conclude that $S_{\pi^*,b} \geq \widetilde{S}_{\pi^*,b} - \frac{\varepsilon}{4k} \geq 1 - \frac{\varepsilon}{k}$ almost surely. Therefore, the circuit $\widetilde{C}'$ succeeds in solving the $(k-1)$-wise direct product of puzzles with probability at least $\Pr_{u \leftarrow \mu_\delta^{k-1}}[g'(u_1, \ldots, u_{k-1})] + \varepsilon$. We see that in this case $\widetilde{C}'$ satisfies the conditions of Lemma 1.6 for the $(k-1)$-wise direct product of puzzles, and we recurse using g' and $\widetilde{C}'$.

If all estimates are less than $(1 - \frac{3}{4k})\varepsilon$, then intuitively C does not succeeds on the remaining $k - 1$ puzzles with much higher probability than an algorithm that correctly solves each puzzle with probability δ. However, from the assumption we know that on all k puzzles the success probability of $\widetilde{C}$ is higher. Therefore, it is likely that the first puzzle is correctly solved unusual often. It remains to prove that this intuition is indeed correct. Let $\mathcal{G}_b := \{b_1, b_2, \ldots, b_k : g(b, b_2, \ldots, b_k) = 1\}$ then we have

$$\Pr_{u \leftarrow \mu_\delta^k}[u \in G_b] = \Pr_{u \leftarrow \mu_\delta^k}[g(b, u_2, \ldots, u_k) = 1]$$
$$\Pr_{\pi^{(k)},\rho}[c \in G_b] = \Pr_{\pi^{(k)},\rho}[g(b, c_2, \ldots, c_k) = 1]. \tag{0.0.10}$$

We fix π^* and use (0.0.9), (0.0.10) to obtain

$$\Pr_{u \leftarrow \mu_\delta^k}[u \in G_1] - \Pr_{u \leftarrow \mu_\delta^k}[u \in G_0] = \Pr_{\pi^{(k)},\rho}[c \in G_1 \mid \pi_1 = \pi^*] - \Pr_{\pi^{(k)},\rho}[c \in G_0 \mid \pi_1 = \pi^*] - (S_{\pi^*,1} - S_{\pi^*,0})$$
$$\tag{0.0.11}$$

Since g is monotone, we have that $\mathcal{G}_0 \subseteq \mathcal{G}_1$, and can write (0.0.11) as

$$\Pr_{u \leftarrow \mu_\delta^k}[u \in \mathcal{G}_1 \setminus \mathcal{G}_0] = \Pr_{\pi^{(k)},\rho}[c \in \mathcal{G}_1 \setminus \mathcal{G}_0 \mid \pi_1 = \pi^*] - (S_{\pi^*,1} - S_{\pi^*,0}). \tag{0.0.12}$$

Still fixing $\pi_1 = \pi^*$ we multiply both sides of (0.0.12) by

$$\Pr_{\substack{\rho \\ x:=\langle P^{(1)}(\pi^*),D_1(\rho)\rangle_{\text{trans}} \\ (\Gamma_V,\Gamma_H):=\langle P^{(1)}(\pi^*),D_1(\rho)\rangle_{P^{(1)}}}} [\Gamma_V(D_2(x,\rho)) = 1]\Big/ \Pr_{u\leftarrow\mu_\delta^k}[u \in \mathcal{G}_1 \setminus \mathcal{G}_0].$$

which yields

$$\Pr_{\substack{\rho \\ x:=\langle P^{(1)}(\pi^*),D_1(\rho)\rangle_{\text{trans}} \\ (\Gamma_V,\Gamma_H):=\langle P^{(1)}(\pi^*),D_1(\rho)\rangle_{P^{(1)}}}} [\Gamma_V(D_2(x,\rho)) = 1]$$

$$= \Pr_{\substack{\rho \\ x:=\langle P^{(1)}(\pi^*),D_1(\rho)\rangle_{\text{trans}} \\ (\Gamma_V,\Gamma_H):=\langle P^{(1)}(\pi^*),D_1(\rho)\rangle_{P^{(1)}}}} [\Gamma_V(D_2(x,\rho)) = 1] \Pr_{\pi^{(k)},\rho} [c \in \mathcal{G}_1 \setminus \mathcal{G}_0 \mid \pi = \pi^*]\frac{1}{\Pr_{u\leftarrow\mu_\delta^k}[u \in \mathcal{G}_1 \setminus \mathcal{G}_0]}$$

$$- \Pr_{\substack{\rho \\ x:=\langle P^{(1)}(\pi^*),D_1(\rho)\rangle_{\text{trans}} \\ (\Gamma_V,\Gamma_H):=\langle P^{(1)}(\pi^*),D_1(\rho)\rangle_{P^{(1)}}}} [\Gamma_V(D_2(x,\rho)) = 1](S_{\pi^*,1} - S_{\pi^*,0})\frac{1}{\Pr_{u\leftarrow\mu_\delta^k}[u \in \mathcal{G}_1 \setminus \mathcal{G}_0]} \qquad (0.0.13)$$

We make use of the facts that $\Gamma_V(D(x,\rho)) = 1$ implies that $c_1 = 1$ and $D_2(x,\rho) \neq \bot$, and that the event $D_2(x^*,\rho) \neq \bot$ implies $c \in \mathcal{G}_1 \setminus \mathcal{G}_0$, which let us write the numerator of the first summand of (0.0.13) as

$$\Pr_{\substack{\rho \\ x:=\langle P^{(1)}(\pi^*),D_1(\rho)\rangle_{\text{trans}} \\ (\Gamma_V,\Gamma_H):=\langle P^{(1)}(\pi^*),D_1(\rho)\rangle_{P^{(1)}}}} [\Gamma_V(D_2(x,\rho)) = 1] \Pr_{\pi^{(k)},\rho} [c \in \mathcal{G}_1 \setminus \mathcal{G}_0 \mid \pi_1 = \pi^*]$$

$$= \Pr_{\substack{\rho \\ x=\langle P^{(1)}(\pi^*),D_1(\rho)\rangle_{\text{trans}}}} [D_2(x,\rho) \neq \bot] \Pr_{\pi^{(k)},\rho} [c_1 = 1 \mid c \in \mathcal{G}_1 \setminus \mathcal{G}_0, \pi_1 = \pi^*] \Pr_{\pi^{(k)},\rho} [c \in \mathcal{G}_1 \setminus \mathcal{G}_0 \mid \pi_1 = \pi^*]$$

$$(0.0.14)$$

Now we consider two cases: if $\Pr_{\pi^{(k)},\rho} [c \in \mathcal{G}_1 \setminus \mathcal{G}_0 \mid \pi_1 = \pi^*] \leq \frac{\varepsilon}{6k}$ then

$$\Pr_{\pi^{(k)}} [c_1 = 1 \mid c \in \mathcal{G}_1 \setminus \mathcal{G}_0, \pi_1 = \pi^*] \Pr_{\pi^{(k)}} [c \in \mathcal{G}_1 \setminus \mathcal{G}_0 \mid \pi_1 = \pi^*] \leq \frac{\varepsilon}{6k}, \qquad (0.0.15)$$

for $\Pr_{\pi^{(k)},\rho} [c \in \mathcal{G}_1 \setminus \mathcal{G}_0 \mid \pi_1 = \pi^*] > \frac{\varepsilon}{6k}$ the circuit D_2 outputs $\bot$ if and only if it fails in all $\frac{6k}{\varepsilon} \log(\frac{6k}{\varepsilon})$ iterations to find $\pi^{(k)}$ such that $g(1,c_2,\ldots,c_k) = 1 \wedge g(0,c_2,\ldots,c_k) = 0$ (i.e. in none of the iterations $c \in \mathcal{G}_1 \setminus \mathcal{G}_0$) which happens with probability

$$\Pr_{\substack{\rho \\ x:=\langle P^{(1)}(\pi),D_1(\rho)\rangle_{\text{trans}}}} [D_2(x,\rho) = \bot] \leq (1 - \frac{\varepsilon}{6k})^{\frac{6k}{\varepsilon} \log(\frac{\varepsilon}{6k})} \leq \frac{\varepsilon}{6k}. \qquad (0.0.16)$$

We conclude that in both cases:

$$\Pr_{\substack{\rho \\ x:=\langle P^{(1)}(\pi^*),D_1(\rho)\rangle_{\text{trans}}}} [D_2(x,\rho) \neq \bot] \Pr_{\pi^{(k)},\rho} [c_1 = 1 \mid c \in \mathcal{G}_1 \setminus \mathcal{G}_0, \pi_1 = \pi^*] \Pr_{\pi^{(k)},\rho} [c \in \mathcal{G}_1 \setminus \mathcal{G}_0 \mid \pi_1 = \pi^*]$$

$$\geq \Pr_{\pi^{(k)},\rho} [c_1 = 1 \mid c \in \mathcal{G}_1 \setminus \mathcal{G}_0, \pi_1 = \pi^*] \Pr_{\pi^{(k)},\rho} [c \in \mathcal{G}_1 \setminus \mathcal{G}_0 \mid \pi_1 = \pi^*] - \frac{\varepsilon}{6k}$$

$$= \Pr_{\pi^{(k)},\rho} [c_1 = 1 \wedge c \in \mathcal{G}_0 \setminus \mathcal{G}_1 \mid \pi_1 = \pi^*] - \frac{\varepsilon}{6k}$$

$$= \Pr_{\pi^{(k)},\rho} [g(c_1,c_2,\ldots,c_k) = 1 \wedge g(0,c_2,\ldots,c_k) = 0 \mid \pi_1 = \pi^*] - \frac{\varepsilon}{6k}$$

$$= \Pr_{\pi^{(k)},\rho} [g(c) = 1 \mid \pi_1 = \pi^*] - \Pr_{\pi^{(k)},\rho} [c \in \mathcal{G}_0 \mid \pi_1 = \pi^*] - \frac{\varepsilon}{6k}$$

$$\overset{(0.0.9)}{=} \Pr_{\pi^{(k)},\rho} [g(c_1,c_2,\ldots,c_k) = 1 \mid \pi_1 = \pi^*] - \Pr_{u\leftarrow\mu_\delta^{(k)}} [u \in \mathcal{G}_0] - S_{\pi^*,0} - \frac{\varepsilon}{6k}. \qquad (0.0.17)$$

For the second summand of (0.0.13) we show that if we do not recurse, then the majority of the estimates is low almost surely. Let us assume that

$$\Pr_{\pi,\rho}\left[\left(S_{\pi,0} \le (1 - \frac{1}{2k})\varepsilon\right) \wedge \left(S_{\pi,1} \le (1 - \frac{1}{2k})\varepsilon\right)\right] < 1 - \frac{\varepsilon}{6k}, \tag{0.0.18}$$

then the algorithm recurses almost surely. Therefore, under the assumption that Gen does not recurse, we have with high probability

$$\Pr_{\pi,\rho}\left[\left(S_{\pi,0} \le (1 - \frac{1}{2k})\varepsilon\right) \wedge \left(S_{\pi,1} \le (1 - \frac{1}{2k})\varepsilon\right)\right] \ge 1 - \frac{\varepsilon}{6k}. \tag{0.0.19}$$

Let us define a set

$$\mathcal{W} = \left\{\pi : \left(S_{\pi,0} \le (1 - \frac{1}{2k})\varepsilon\right) \wedge \left(S_{\pi,1} \le (1 - \frac{1}{2k})\varepsilon\right)\right\} \tag{0.0.20}$$

and use $\mathcal{W}^c$ to denote the complement of $\mathcal{W}$. We bound the second summand in (0.0.13)

$$\mathbb{E}_{\pi^*}[S_{\pi^*,0} \quad + \quad \Pr_{\rho}\ [\Gamma_V(D_2(x,\rho)) = 1](S_{\pi^*,1} - S_{\pi^*,0})]$$
$$\scriptstyle x := \langle P^{(1)}(\pi^*), D_1(\rho)\rangle_{\mathrm{trans}}$$
$$\scriptstyle (\Gamma_V,\Gamma_H) := \langle P^{(1)}(\pi^*), D_1(\rho)\rangle_{P^{(1)}}$$

$$= \mathbb{E}_{\pi^* \in \mathcal{W}^c}[S_{\pi^*,0} \quad + \quad \Pr_{\rho}\ [\Gamma_V(D_2(x,\rho)) = 1](S_{\pi^*,1} - S_{\pi^*,0})]$$
$$\scriptstyle x := \langle P^{(1)}(\pi^*), D_1(\rho)\rangle_{\mathrm{trans}}$$
$$\scriptstyle (\Gamma_V,\Gamma_H) := \langle P^{(1)}(\pi^*), D_1(\rho)\rangle_{P^{(1)}}$$

$$+ \ \mathbb{E}_{\pi^* \in \mathcal{W}}[S_{\pi^*,0} \quad + \quad \Pr_{\rho}\ [\Gamma_V(D_2(x,\rho)) = 1](S_{\pi^*,1} - S_{\pi^*,0})]$$
$$\scriptstyle x := \langle P^{(1)}(\pi^*), D_1(\rho)\rangle_{\mathrm{trans}}$$
$$\scriptstyle (\Gamma_V,\Gamma_H) := \langle P^{(1)}(\pi^*), D_1(\rho)\rangle_{P^{(1)}}$$

$$\le \ \frac{\varepsilon}{6k} + \mathbb{E}_{\pi^* \in \mathcal{W}^c}[S_{\pi^*,0} \quad + \quad \Pr_{\rho}\ [\Gamma_V(D_2^{\widetilde{C}}(x,\rho)) = 1]((1 - \frac{1}{2k})\varepsilon - S_{\pi^*,0})]$$
$$\scriptstyle x := \langle P^{(1)}(\pi^*), D_1(\rho)\rangle_{\mathrm{trans}}$$
$$\scriptstyle (\Gamma_V,\Gamma_H) := \langle P^{(1)}(\pi^*), D_1(\rho)\rangle_{P^{(1)}}$$

$$\le \ \frac{\varepsilon}{6k} + 1 - \frac{\varepsilon}{2k} = 1 - \frac{\varepsilon}{3k}. \tag{0.0.21}$$

We observe that

$$\Pr_{u \leftarrow \mu_\delta^k}[g(u) = 1] = \Pr[u \in \mathcal{G}_0 \vee (u \in \mathcal{G}_1 \setminus \mathcal{G}_0 \wedge u_1 = 1)]$$
$$= \Pr[u \in \mathcal{G}_0] + \Pr[u \in \mathcal{G}_1 \setminus \mathcal{G}_0]\Pr[u_1 = 1]. \tag{0.0.22}$$

Finally, we insert (0.0.17) and (0.0.21) into equation (0.0.13) and use (0.0.22) to obtain

$$\Pr_{\rho}\ [\Gamma_V(D_2(x,\rho)) = 1] \ge \mathbb{E}_{\pi^*}\left[\frac{\Pr_{\pi^{(k)},\rho}[g(c) = 1 \mid \pi_1 = \pi^*] - \Pr_{u \leftarrow \mu_\delta^k}[u \in G_0] - (1 - \frac{1}{6k})\varepsilon}{\Pr_{u \leftarrow \mu_\delta^k}[u \in \mathcal{G}_1 \setminus \mathcal{G}_0]}\right].$$
$$\scriptstyle x := \langle P^{(1)}(\pi^*), D_1(\rho)\rangle_{\mathrm{trans}}$$
$$\scriptstyle (\Gamma_V,\Gamma_H) := \langle P^{(1)}(\pi^*), D_1(\rho)\rangle_{P^{(1)}}$$

From the assumptions of Lemma 1.6 we know that $\Pr_{\pi^{(k)},\rho}[g(c) = 1] \ge \Pr_{u \leftarrow \mu_\delta^{(k)}}[g(u) = 1]$, thus we get

$$\Pr_{\rho}\ [\Gamma_V(D_2(x,\rho)) = 1] \ge \frac{\Pr_{u \leftarrow \mu_\delta^k}[g(u) = 1] + \varepsilon + \Pr_{u \leftarrow \mu_\delta^k}[u \in \mathcal{G}_0] - (1 - \frac{1}{6k})\varepsilon}{\Pr_{u \leftarrow \mu_\delta^k}[u \in \mathcal{G}_1 \setminus \mathcal{G}_0]}$$
$$\scriptstyle x := \langle P^{(1)}(\pi^*), D_1(\rho)\rangle_{\mathrm{trans}}$$
$$\scriptstyle (\Gamma_V,\Gamma_H) := \langle P^{(1)}(\pi^*), D_1(\rho)\rangle_{P^{(1)}}$$

$$\ge \frac{\varepsilon + \delta\Pr_{u \leftarrow \mu_\delta^k}[u \in \mathcal{G}_1 \setminus \mathcal{G}_0] - (1 - \frac{1}{6k})\varepsilon}{\Pr_{u \leftarrow \mu_\delta^k}[u \in \mathcal{G}_1 \setminus \mathcal{G}_0]} \ge \delta + \frac{\varepsilon}{6k} \tag{0.0.23}$$
$$\square$$

Proof (Theorem 1.3). We show that Theorem 1.3 follows from Lemma 1.4 and Lemma 1.6. For fixed $P^{(1)}$, g, $P^{(g)}$ given a solver circuit $C = (C_1, C_2)$ such that

$$\Pr_{\pi^{(k)},\rho}\left[Success^{P^{(g)},C}(\pi^{(k)}, \rho) = 1\right] \geq 8(h+v)\left(\Pr_{u \leftarrow \mu_\delta^k}[g(u) = 1] + \varepsilon\right)$$

we apply Lemma 1.4 to find a function $hash$ such that

$$\Pr_{\pi^{(k)},\rho}\left[CanonicalSuccess^{P^{(g)},C,hash}(\pi^{(k)}, \rho) = 1\right] \geq \Pr_{u \leftarrow \mu_\delta^k}[g(u) = 1] + \varepsilon.$$

By Lemma 1.5 we know that it is possible to create a circuit $\widetilde{C} = (C_1, \widetilde{C}_2)$ with oracle access to $hash$ and C such that

$$\Pr_{\substack{\pi,\rho \\ x:=\langle P(\pi),C_1(\rho)\rangle_{\mathrm{trans}} \\ (\Gamma_V^{(g)},\Gamma_H^{(k)}):=\langle P(\pi),C_1(\rho)\rangle_P}}[\Gamma_V^{(g)}(\widetilde{C}_2^{\Gamma_H^{(k)},C_2,hash}(x,\rho)) = 1] \geq \Pr_{u \leftarrow \mu_\delta^k}[g(u) = 1] + \varepsilon.$$

Now, we apply Lemma 1.6 for the function $hash$ and $\widetilde{C} = (C_1, \widetilde{C}_2)$ and obtain a circuit $D = (D_1, D_2)$ such that

$$\Pr_{\substack{\pi,\rho \\ x:=\langle P^{(1)}(\pi),D_1(\rho)\rangle_{\mathrm{trans}} \\ (\Gamma_H,\Gamma_V):=\langle P^{(1)}(\pi),D_1(\rho)\rangle_{P^{(1)}}}}[\Gamma_V(D_2(x,\rho)) = 1] \geq (\delta + \frac{\varepsilon}{6k}). \tag{0.0.24}$$

Finally, we build a circuit $\widetilde{D} = (D_1, \widetilde{D}_2)$ that in the first phase uses D_1, and in the second phase uses D_2 to find (q, y), with which it makes a verification query to the oracle.

Circuit: $\widetilde{D}_2^{D,P^{(1)},P^{(g)},hash,\Gamma_v}()$

Oracle: A circuit D, problem posers $P^{(1)}$, $P^{(g)}$,
        a function $hash : Q \to \{0,1,\ldots,2(h+v)-1\}$,
        a verification oracle Γ_V, a hint oracle Γ_H
Input: Bitstrings $x \in \{0,1\}^*$, $\rho \in \{0,1\}^*$

$(q,y) := D_2^{P^{(1)},P^{(g)},\widetilde{C},hash,\Gamma_H,\Gamma_V}(x,\rho)$
Make a verification query to Γ_V using (q,y)

We know that the probability that the verification query (q,y) succeeds amounts at least $(\delta + \frac{\varepsilon}{6k})$. Therefore, we have

$$\Pr_{\pi,\rho}\left[Success^{P^{(1)},\widetilde{D}}(\pi, \rho) = 1\right] \geq (\delta + \frac{\varepsilon}{6k}). \qquad \square$$

Algorithm: $\widetilde{Gen}$

Oracle: Problem posers $P^{(1)}$, $P^{(g)}$, a function $g : \{0,1\}^k \to \{0,1\}$,
        a solver circuit C for $P^{(g)}$.
Input: Parameters n, ε, δ, k, h, v.

$hash := FindHash(\gamma, n, h, v)$
Let $\widetilde{C} = (C_1, \widetilde{C}_2)$ be as in Lemma 1.5 with oracle access to C.

$$D := Gen^{P^{(1)}, P^{(g)}, \widetilde{C}, hash, g}(\varepsilon, \delta, n, k)$$
return $\widetilde{D} := (D_1, \widetilde{D}_2)$

Finally, we conclude that the Theorem 1.3 holds with the algorithm $\widetilde{Gen}$ used to generate the solver circuit $\widetilde{D}$,
